

Inheritance: The capability of a class to derive properties and characteristics from another class is called 9nheritance.

- Subclass Subclass
- · Superclass
 - · Reusability

Dynamic Binding: In dynamic banding, the code to be executed an response to function call 18 decided at run time.

triend class B3

Constructors: A constructor is a member function of a class. Which initializes objects of a class. In Ct constructor is automatically called when the object creates.

It has some name as class 9+self. sightime

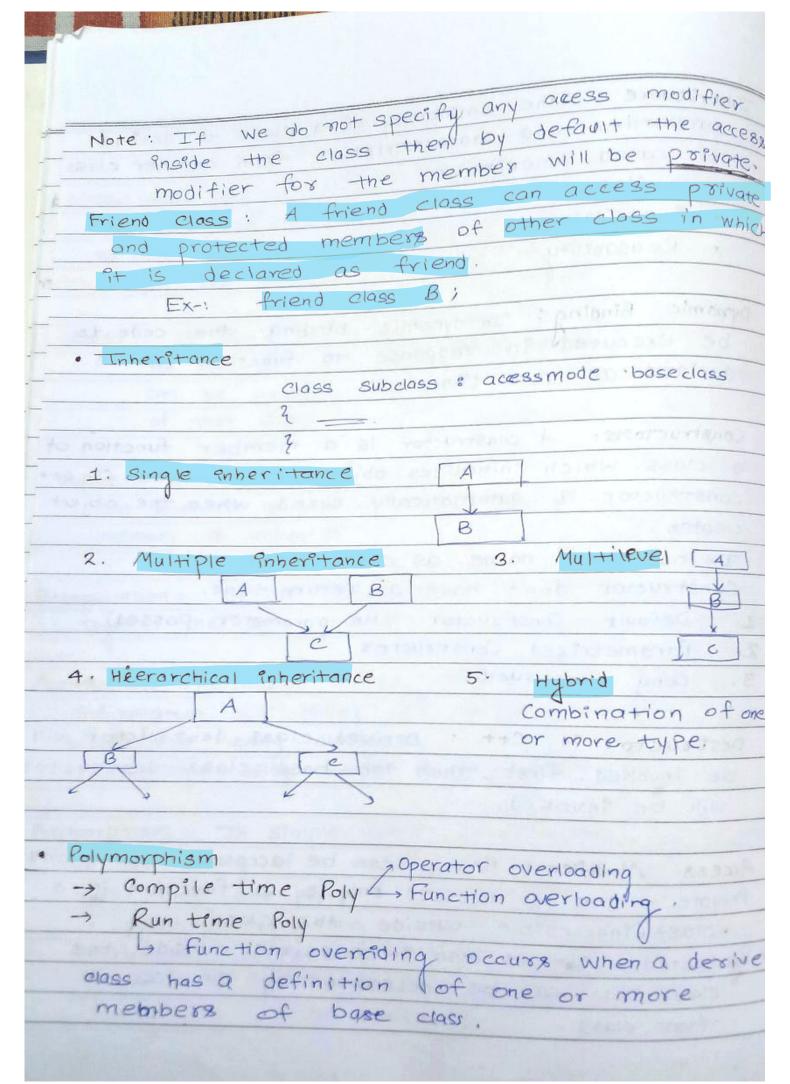

Constructor don't have a return type,

- 1. Default Constructor (No parameter passed)
- 2. Parametrized Constructor
- 3. Copy Constructor sometiment insideroral ++

Destructor in C++: Derived class destructor will be invoked first, then the base class destructor will be invoked.

Access Modifier: Public - can be accessed by any class Private: - can be accessed bonly by a function in a class (Praccessible outside the class).

Protected: It is also praccessible outside the class but can be accessed by subclass of that class.

Advantages of Data Abstraction . Avoid code duplication and anc. reusability. can change internal implementation of class Latine Function a andependently. Staucture Vs class: Most Empositions difference is security. A Structure 98 not secure and cannot hide 948 member function and variable while class 18 secure and can hide 9+8 programming & designing details. to fir the agreeting - type a strate of the same Local Classes in C++: A class declared inside a function becomes local to that function and is called All the methods of local class must be defined local floss. Enside the class only no snorth som to out difficult stammeters Virtual function and Runtime Polymorphism: A virtual function is a member function which is declared within a base class and redefined (overriden) by derived class. functions are declared with Virtual Keyword in print (float 1) base class,

Exception Handling Pin C++:

toy: represent a block of code that can throw

an exception.

Catch: represent a block of code that get executed

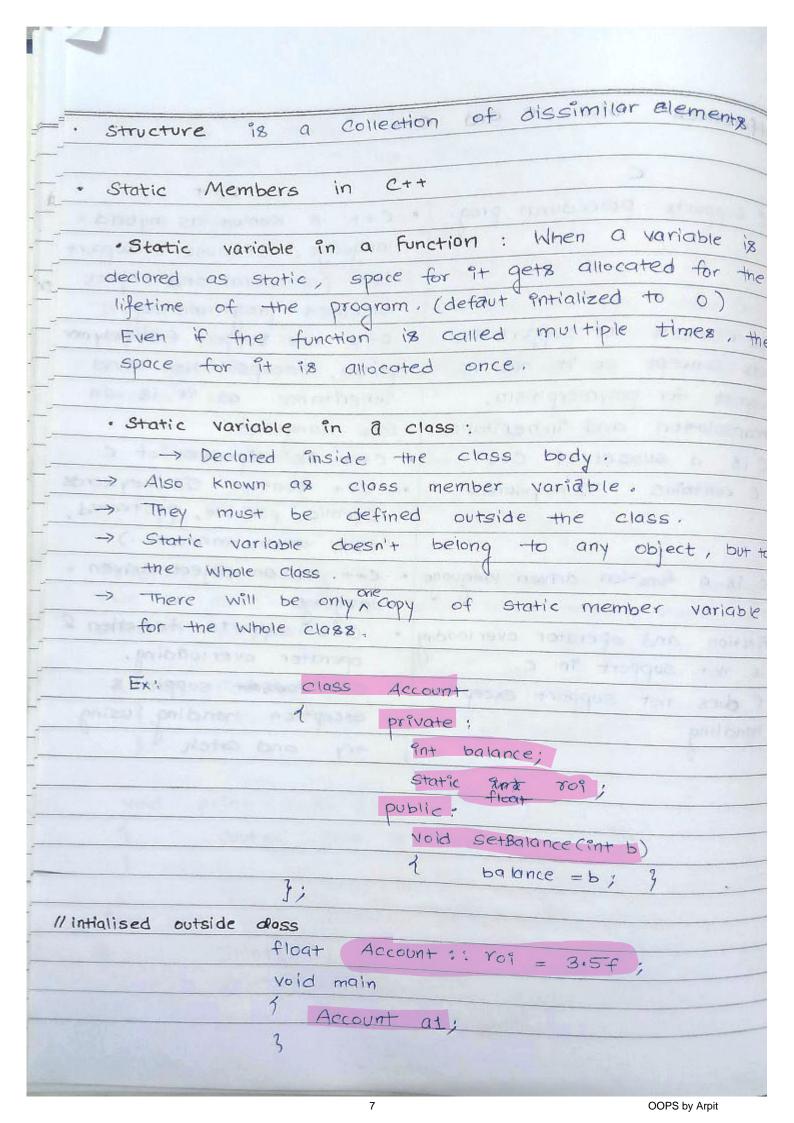

when error is thrown

Throw! Used to throw on exception.

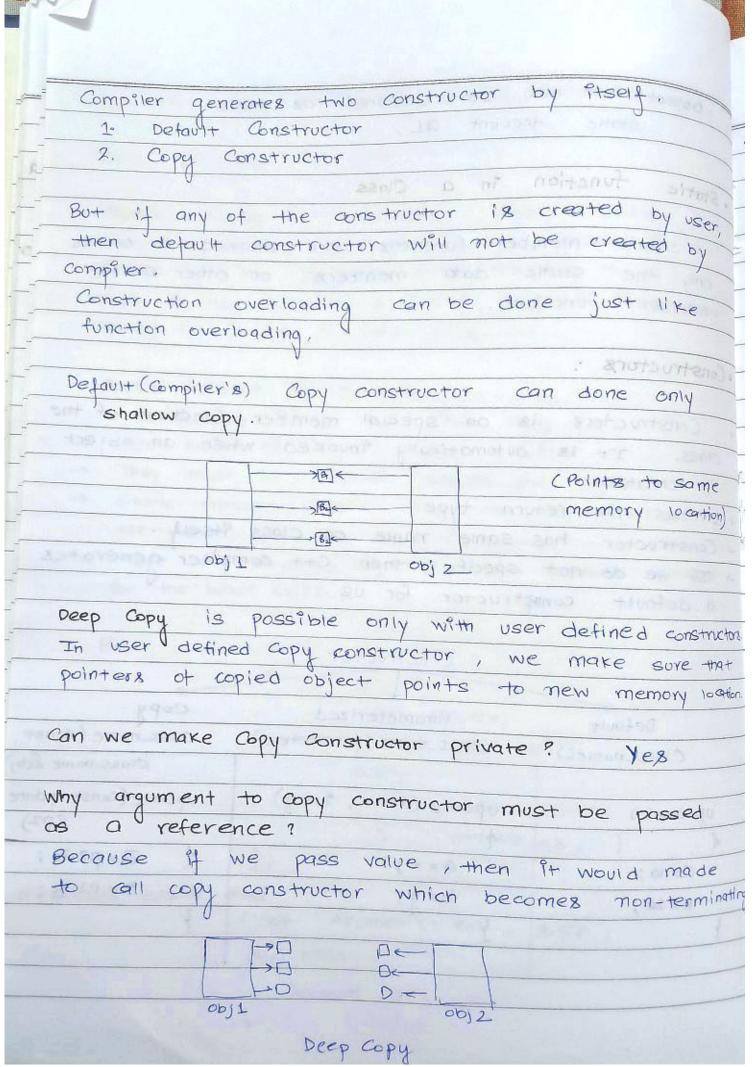

There is a special conth block -> catch(... It catches all types of error. · Inline Function -> inline is a request not command. It is function that is expanded in line When it colled. When the inline function is called, whole code get 9nserted or substituted at the point of function call, in line return-type fun() DOCT - ---SHED BY CAN THE COM Function Overloading 98 a feature 9n C++ When two or more functions can have same name b different parameters. that Function and Runtime Palymorphism: void print (int ?) L' Cout << "Here ix 9n+ " << 9 << end); void print (float i) { coutce "Here is float" <= i <= endl; 1 ++ 3 of pailbant poly TO TOUR PRODUCT TO SOUTH O int main 1 print(10); print (10.12);

Virtual Function

A virtual function is a member function which is declared with a 'virtual keyword' in the base class and redeclared (overridden) in a degived class. When you refer to a object of derived class using pointer to a base class, you can call a virtual function of that object and execute the derived class's version of the function.

- · They are used to achieve Run time Polymorphism.
- Virtual Function cannot be Static and also cannot be from function of another class.

ent main () base * bptr ; STAN derived der; bptr = lder; bptr > print(); // Run time bptr -> show(); // Compile time The profession of the state of output: derived printo tells both 11 Late Binding This Base show fun // Early binding sometimes implementation of an function connet i As during compiler time bptr behaviour judged on the base's of which class at belong, so both represent If the function is not virtual then it will allow binding base class. at compiler time and print fun of base class will get binded b/c bptr grepresent base class. But at run time bptr points to the object of class derived, so 9+ will fubind function of derived at run time. // Abstract Class Working of Virtual Function (VTable & VPtr) If a class contains virtual function then compiler itself 1. A virtual pointer (VPTR) is created every-time obj is does two things ! created for that class which contains virtual function. Irrespective of object is created or not, static array of pointer called VTABLE where each cell point to each virtual function 18 created, in bose closs and derived class.

We cannot declare object of abstract Closs. Test t: Will show error done house that his a mon-virtual vicestructi We can have pointer or reference of abstract class. 1985 1997 1885 1888 40 TOFUTOR We can access the other functions except virtual by object of its derived class. If we don't override the pure virtual function in derived class then it becomes abstract. 5. An abstract class can have constructors, clost, melybest (Read from GifGi) class Enclosing Template in C++ template < class X> Pat cneck (igt a, x b) 1 7 7.07 3 it (a>b) boresu ento return a; else return b; · (B + MI) and by It done just help in data type. So that we can write generic function that can be used for different data type.
